Lantus® SoloSTAR® Video – José

Super: José, Taking Lantus® (insulin glargine injection) 100 Units/mL SoloSTAR® since 2007.

José: What I like about Lantus® is that I only have to take it once-a-day, and it lasts for 24 hours.

Super: Do not take Lantus® if you are allergic to any of its inactive ingredients.

Super: The most common side effect of insulin is low blood sugar (hypoglycemia), which may be serious and life threatening.

José: Me, I’ll take it in the morning, and it lasts me all day all night.

Super: Insulin is taken as part of an overall diabetes treatment plan, which may include diet, exercise and other diabetes medications.

José: All you have to do is screw on the needle, turn the dial, put the units…the amount of units the doctor has prescribed, and inject it.

Super: Do not share needles, insulin pens or syringes with others. Do NOT reuse needles.

Super: Follow all steps in the instruction leaflet that comes with your pen. Otherwise, you may not get the correct amount of insulin injected which may affect your blood sugar levels.

José: It’s such a small needle…I use a 31-gauge needle. It’s very thin, so I hardly feel a thing.

Super: Individual injection discomfort levels may vary.
